

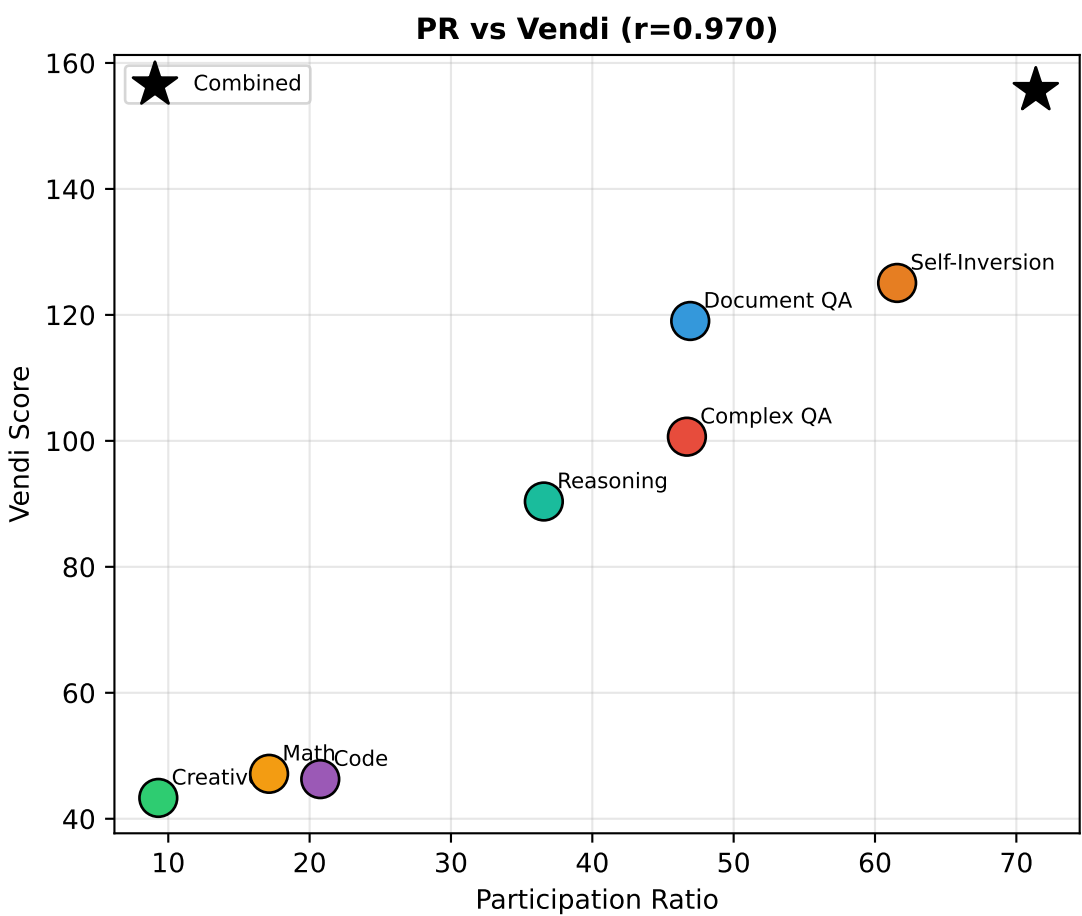

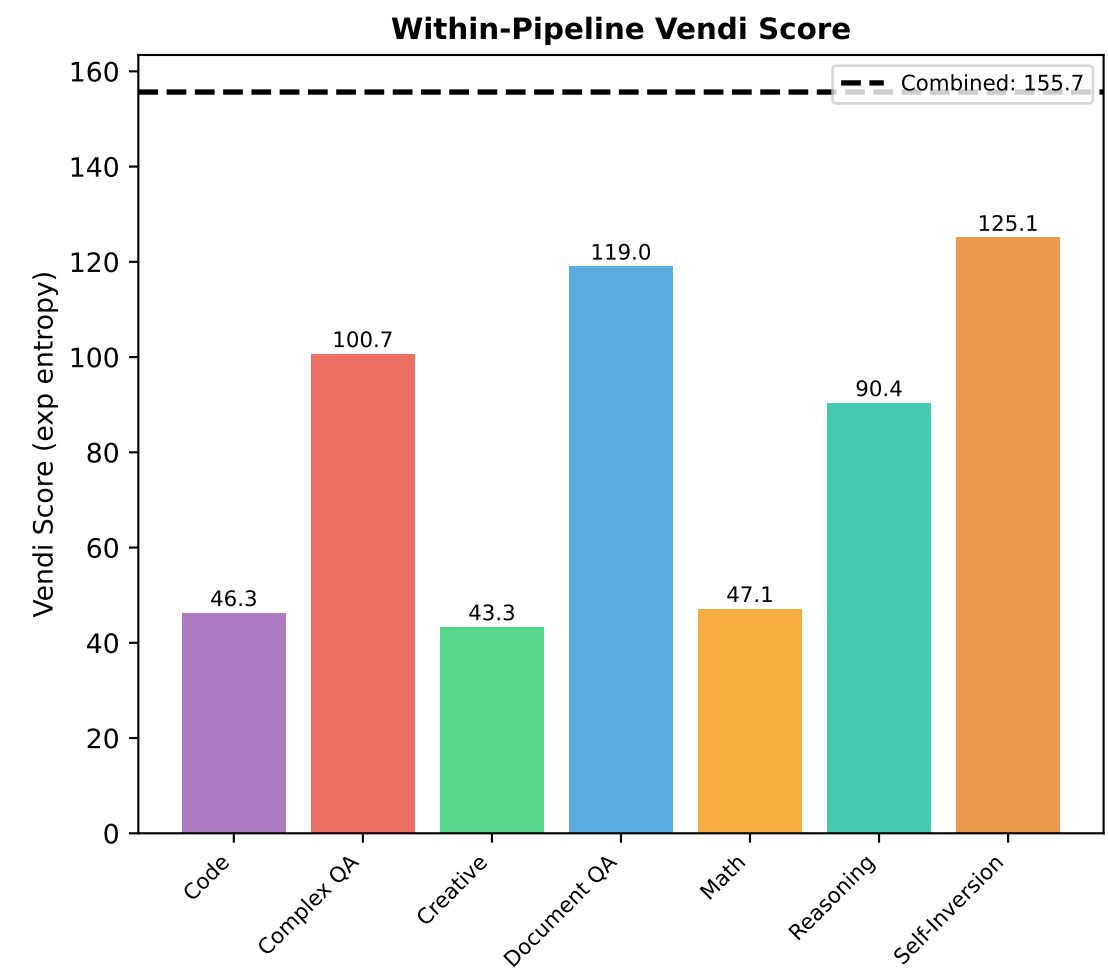

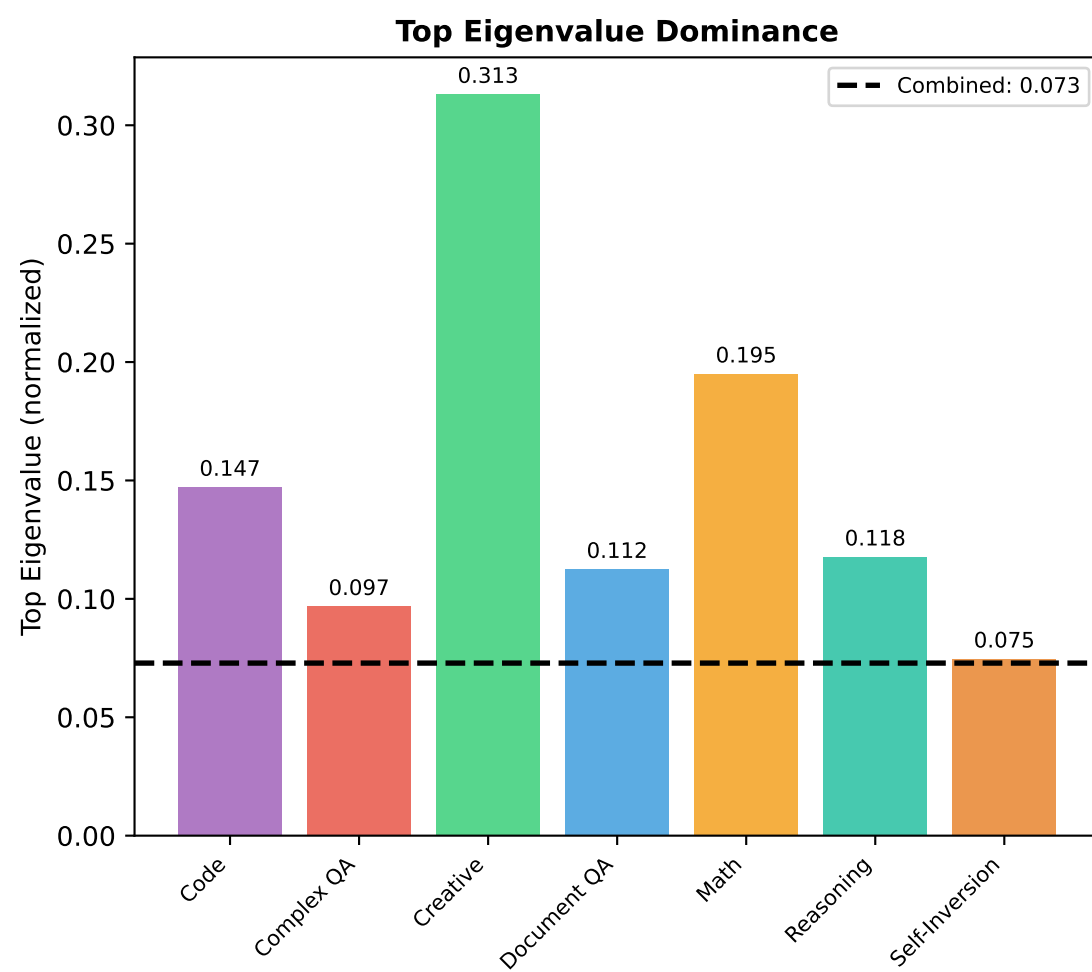

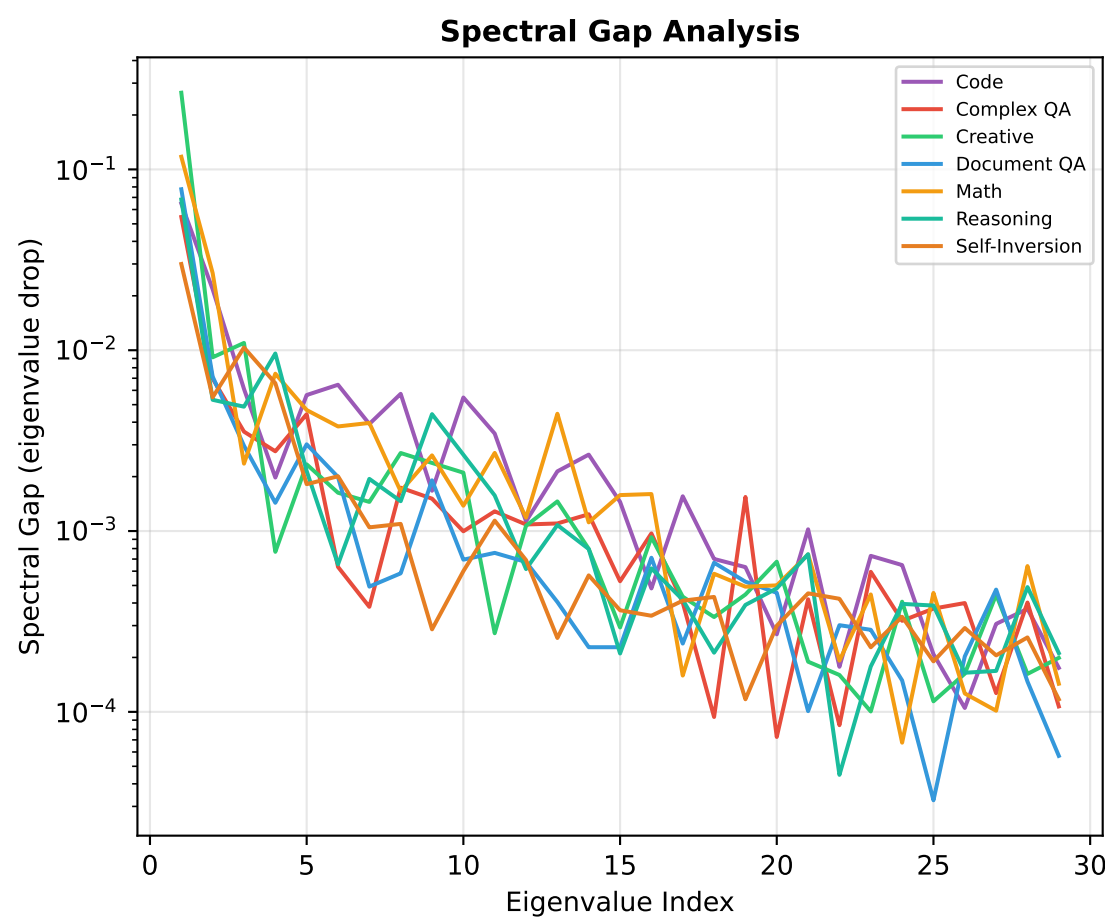

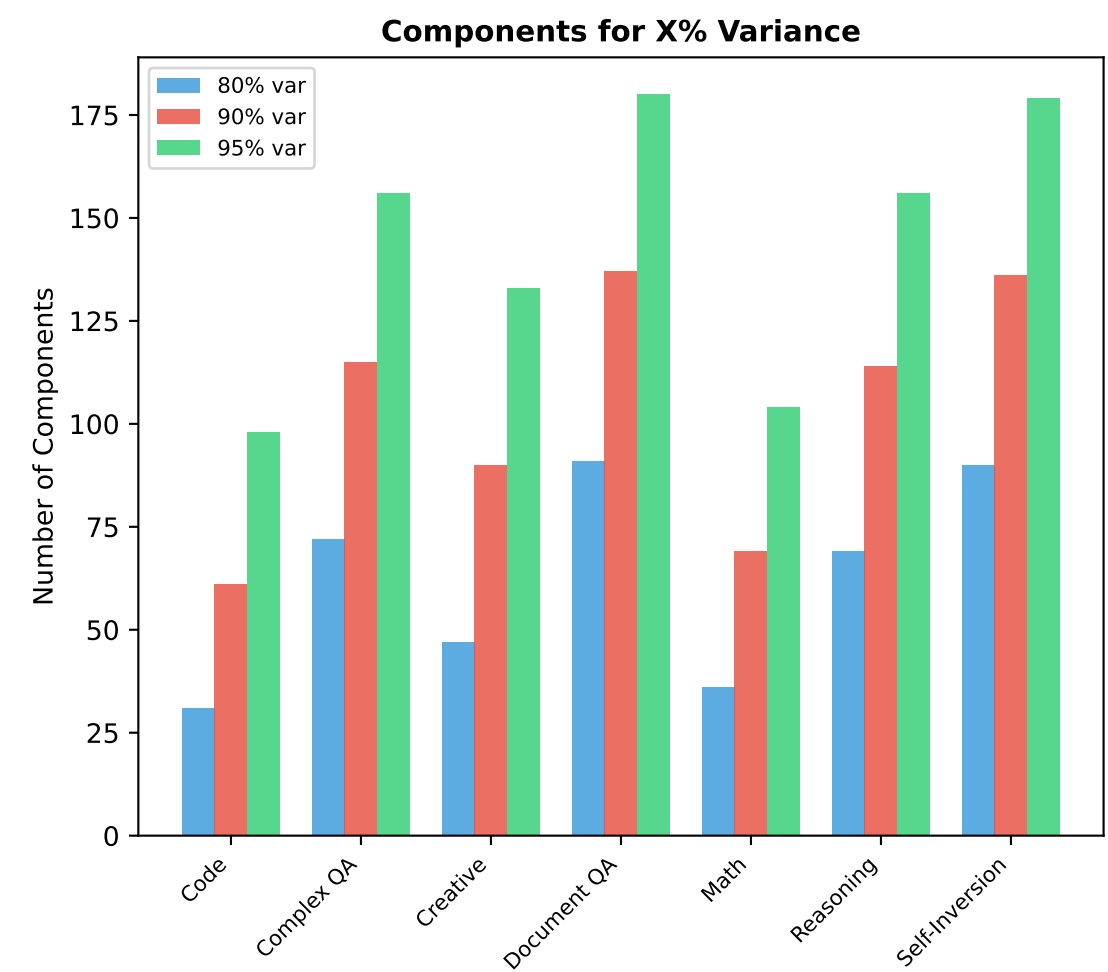

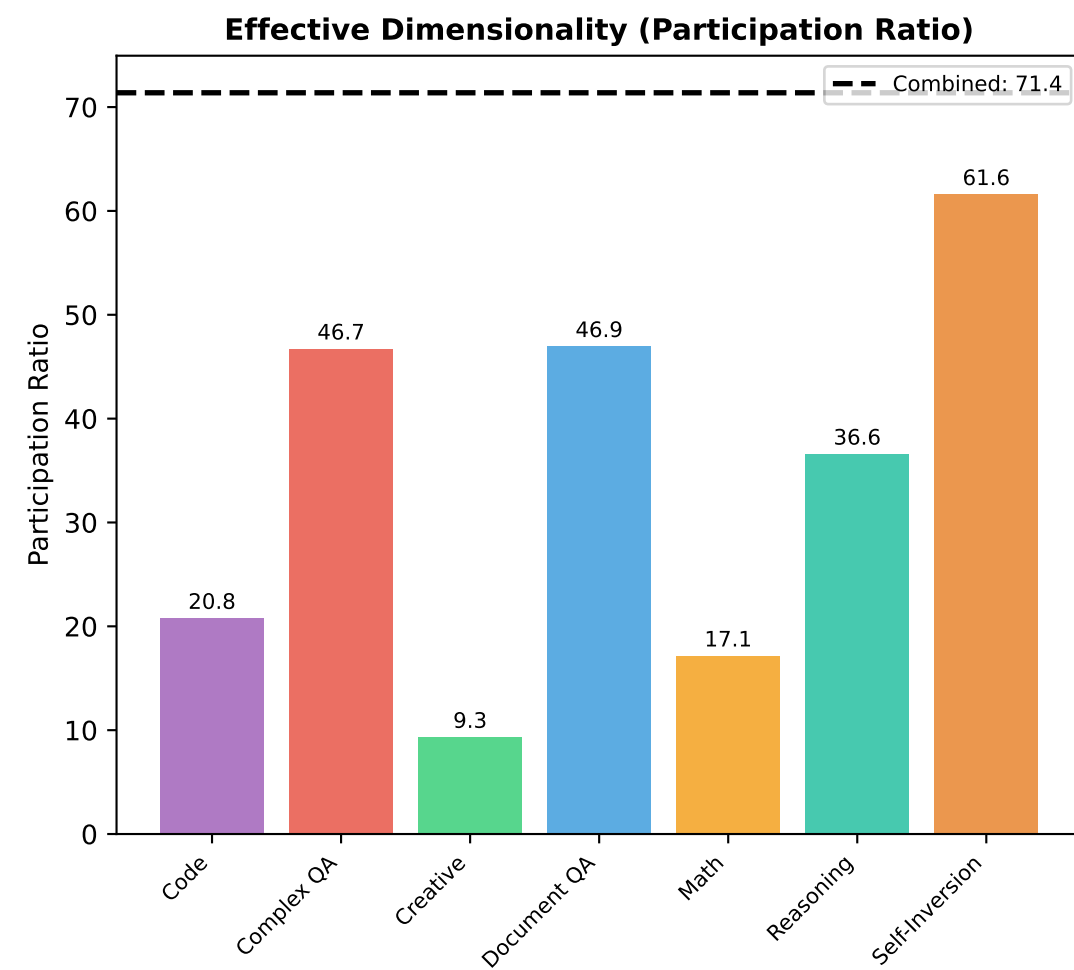

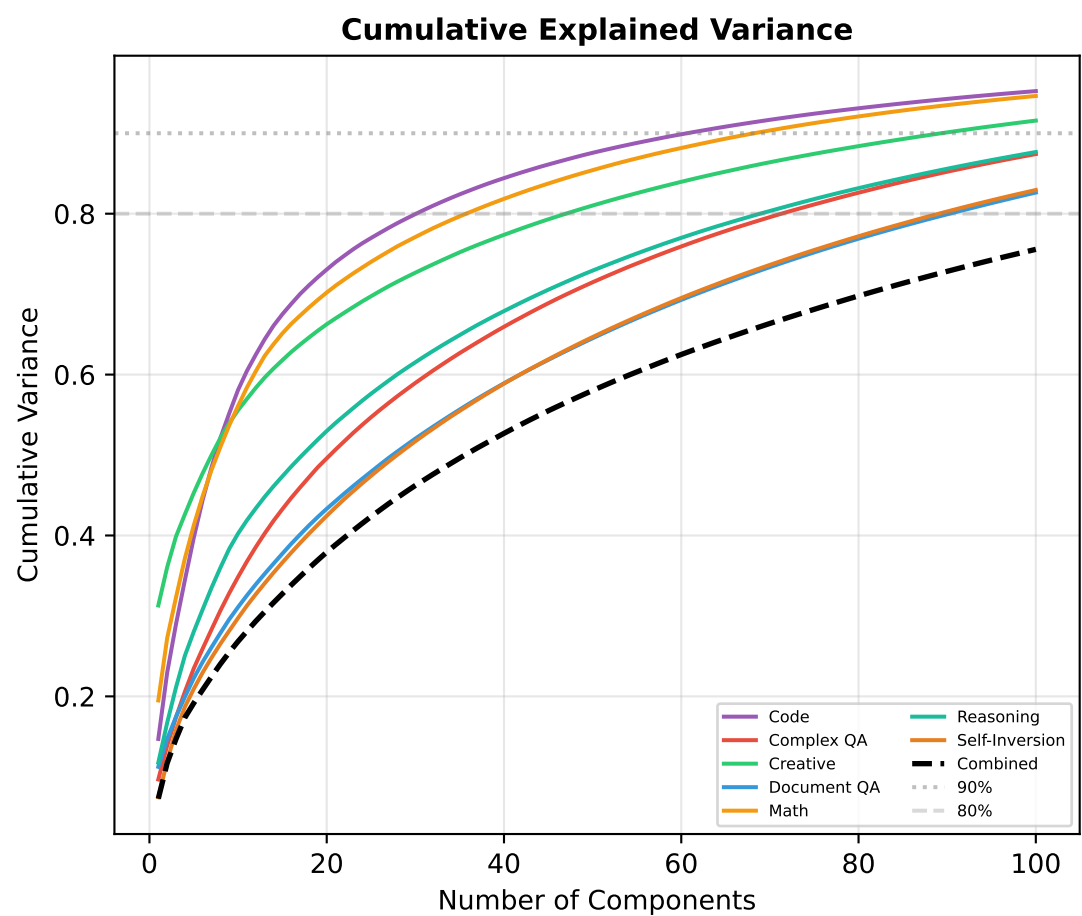

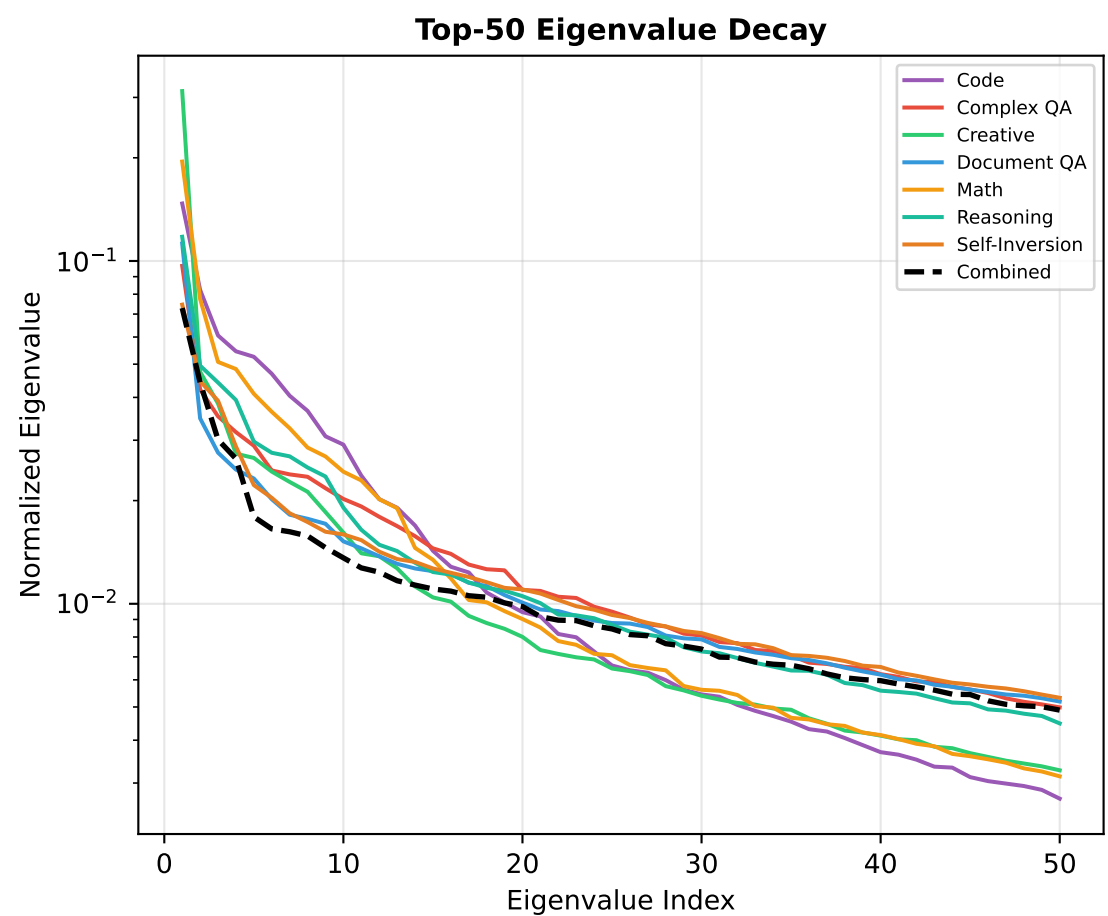

Fig 176: Eigenvalue Spectrum & Spectral Signature Analysis

Spectral Analysis Summary

Combined dataset:
PR = 71.4, Vendi = 155.7
d90 = 178 components

Per-pipeline:
Highest PR: Self-Inversion (61.6)
Lowest PR: Creative (9.3)
Highest Vendi: Self-Inversion (125.1)

PR-Vendi correlation: 0.970

Key Findings:
1. Self-Inversion has highest effective dim
2. Math/Code most concentrated spectrum
3. Combined dataset PR > any single pipeline (confirming complementary coverage)
4. Eigenvalue decay rate reflects pipeline diversity: slow decay = high diversity
